

ADDING RELATED TABLE EXERCISE

Your organization needs to track the names addresses and telephone numbers of the analysts (there can be several for each period) that are responsible for submitting the excess Grant reports that are the source of data in the Excess1.mdb database. This information must be retained for future reference.

1. Build new tables to support this requirement for new information.
2. Develop a way to link the two tables together and execute it. See if you can use a composite key to establish the link.
3. Build a form and add new data for three states to the database. Make sure that some of these states have two or more responsible analysts entered so that you can fully test your implementation.
4. Prepare a report that selects only the states that you have added responsible analysts to the database and displays management information.
